

Now you can have a
pollution free environment

We are an ISO 9001:2008 Company
Powertech Pollution Controls Pvt. Ltd.
Bangalore, India.

Company Profile

Powertech Pollution Controls Pvt Ltd was established in the year 1996 , for the design and manufacture of a wide range of air pollution control equipment , specifically Electrostatic Filters, for the capture and control of most types of fumes , mist , smoke and fine dust , generated on the shop floor , during the production process. Electrostatic filters are marketed under the brand name of Fumekiller® and Dustkiller® throughout India and abroad.

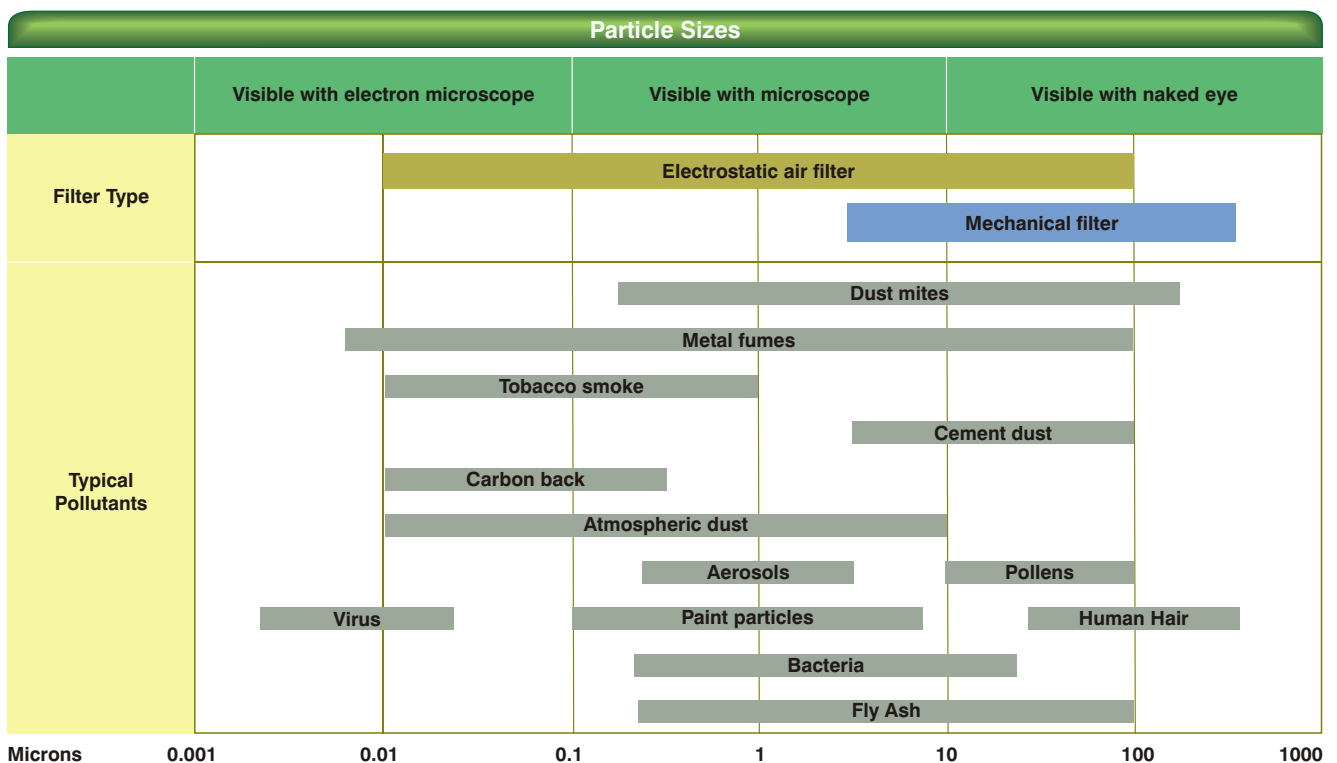

These systems are highly efficient (90% to 98%), use 40% less power, have very low maintenance, use permanent , many times re-usable filter media ,and can capture particulates down to 0.01 micron level (theoretical limit of 2-stage electrostatic filtration), and are ideal for the capture of fumes, smoke, oil/coolant mist and fine powders with the additional advantage of possible reuse of the collected oil/coolant or powder. These Filters may also be used for Clean Room applications of upto Class 1,00,000, and as efficient prefilters for higher class of Clean Rooms (where the life of expensive terminal HEPA filters can be extended by about 3 times).

A wide range of 2-stage Electrostatic filters are being used by many industry leaders, including Wipro Infrastructure Ltd, Toyota Kirloskar Motors , TVS Motor Co., Hindusthan Aeronautics Ltd, Bharat Electronics Ltd, Yuken India Ltd, Kennametal India Ltd, Maruti Suzuki India Ltd., Bhaba Atomic Research Centre, Automotive Axles Ltd , Vikram Sarabhai Space Centre , Delphi TVS Ltd , Reserve Bank of India , Titan Industries Ltd , Exide India Ltd , ABB Ltd , among many others.

These are typically used for the capture of fumes , smoke ,mist and fine dust from welding , CNC machining , quenching , hardening , heat treatment ,annealing , soldering , tinning , diesel gensets , curing ,boilers , furnaces , etc.

Our fume extraction systems have been approved by Agie Charmilles Technologies, Switzerland, for use with their Electro Discharge Machines in India , for the control of fumes. We also manufacture a range of unit dust collectors under the brand name of DustBag® which are used for the capture of most types of dry and mildly wet dust from cast iron machining , surface grinders , tool & cutter grinders, deburring , polishing , mixing , stripping , etc

The Managing Director - Mr. Philip Thomas, B.E. (Hons.) Electronics, B.E. (Hons.) Electrical, M.B.A has over a decade of Industrial experience in senior management positions . With his association with the Semiconductor industry, he initiated the design and manufacture of Electrostatic Filters using state-of-the-art technology. Our marketing team consists of engineers, who will undertake technical site study and suggest the optimal solution. The company has a team of dedicated representatives in place , throughout India, who will provide excellent application study and service backup, to solve most of your problems concerning airborne pollutants. Quality Control is an obsession through out the organisation and is evident in the list of our highly satisfied customers.

Fumekiller® - Electrostatic Filtration System is a high-efficiency two-stage electrostatic precipitator, designed, developed and manufactured for the capture & control of fumes, mist, smoke & fine dust.

Features : The filter modules are many times washable and re-usable during the life of the equipment. Maintenance and running costs are low when compared to conventional mechanical filters. We have incorporated safety features such as motor protection, limit switches and high voltage fault trip circuitry for reliable, safe and efficient functioning. These systems contribute to a safer, healthier work environment where toxic airborne pollutants are removed. We provide excellent factory support and product expertise based on years of industrial process emission control.

Applications : Fumekiller® can be used for the capture and control of fumes, smoke & fine dust, from Welding, EDM, Induction hardening, Ink spray, Heat treatment, Oil quenching, Wire drawing, Annealing, Soldering, Dip tinning, Wave soldering, Rubber curing, Die casting, Oil mist, Coolant mist, Diesel gensets, etc. Fumekiller® can also be used for capturing fine powder from tableting, capsuling and finishing operations.

How it Works : Particles in fumes, smoke or dust stream enter the electrostatic filter through the suction inlet (1) Particles carried by the air stream first enter the pre-filter (2) where large particles are removed. The finer particles then enter the electrostatic module (3) where, between a series of parallel aluminium plates, they receive a high +ve charge. These positively charged particles then pass through another series of aluminium plates which are negatively charged. Here, the particles are attracted to the oppositely charged aluminium plates and stick to them just like iron filings are attracted to a magnet, but, with one difference, the particles remain adhered to the plates even when the electrostatic filter is switched off. The air, now devoid of particles, escapes through the outlet (5) of the system as clean air. The post filter (4) evenly distributes the air flow through the electrostatic modules. Post filters when fitted with activated carbon granules can control odour & smell. Suction is provided with a centrifugal fan (6)

We are an ISO 9001:2008 Company

Dustkiller® - Dust filtration system, is a high-efficiency, two-stage electrostatic precipitator, designed, developed and manufactured by Powertech Pollution Controls Pvt. Ltd. Bangalore, India.

Features: This equipment can achieve a high level of dust control in any closed area. Very fine floating particles can be captured before they can settle down on sensitive precision equipment. It provides high dust capture efficiency. All filter modules are many times washable and re-usable during the life of the equipment. Maintenance and running costs are low when compared to conventional mechanical filters. We have incorporated safety features such as high voltage fault trip circuitry for reliable, safe and efficient functioning. These systems contribute to a safer, healthier work environment where toxic airborne pollutants are removed. We provide excellent factory support and product expertise based on years of industrial process emission control.

Applications : Dustkiller® can be used for controlling dust and fine particles in any closed room, preferably but not necessarily fitted with window / split type airconditioners - electronic labs, mechanical precision assembly areas, standards room, metrology labs, pharmaceuticals, bio-tech labs etc., or wherever dust control is a necessity. Dustkiller® can be quickly installed without major changes in the existing area.

How it Works: Dust and fine particulate matter are sucked in with the air stream by the centrifugal blower (1) through the inlet (2) on top. These enter the prefilter (3) where large particles are removed. The remaining fine particles then enter the electrostatic modules (4) where, between a series of parallel aluminium plates, they receive a high +ve charge. These positively charged particles then pass through another series of aluminium plates which are negatively charged. Here, the particles are attracted to the oppositely charged aluminium plates and stick to them just like iron filings are attracted to a magnet, but with one difference - the particles remain adhered to the plates even when the electrostatic filter is switched off. The air, now devoid of particles, escape through the outlet (5) as clean air. The postfilter (6) help in even distribution of air flow through the electrostatic module and also controls odor & smell when filled with activated carbon granules.

Filter Modules

These Filter Modules are high-efficiency, two-stage electrostatic filters, designed, developed and manufactured by Powertech Pollution Controls Pvt. Ltd. Bangalore, India.

Features: The filter modules are many times washable and re-usable during the life of the equipment. Maintenance and running costs are low when compared to conventional mechanical filters. We have incorporated safety features such as high voltage fault trip circuitry for reliable, safe and efficient functioning. These systems contribute to a safer, healthier work environment where toxic airborne pollutants are removed. We provide excellent factory support and product expertise based on years of industrial process emission control.

Applications : These modular filters are used for custom-built applications & can be added module by module to suit various air flow rates. These modules are used as primary filters for class 100,000 Clean Rooms & as prefilters for higher Class levels of Clean Rooms. When used as prefilters for higher class levels, they can increase the life of the terminal filters. The total pressure drop as compared to conventional prefilters is negligible. These filters can be used in a centralized system for removal of fumes, smoke, oil mist, coolant mist, dust and fine powders from many in - plant industrial processes which generate pollutants rendering the shop floor unhealthy.

How it Works : Each filter module can handle an air flow rate as specified. The required quantity of modules are placed in an MS painted enclosure. The air inlet side is placed in the air stream using a suitable adaptor ducting. The power pack feeding the electrostatic voltages to the Modules is separately mounted in a control panel near the MS enclosure with the electrical connections made through conduits. Prefilters and post filters are placed before and after the electrostatic filter module. Dust and file particulate are sucked into the filter module with the air stream. These first enter the prefilters which prevent large particles entering the modules. The fine particles then enter the modules where, between a series of parallel aluminium plates, they receive a high positive charge. The positively charged particles then pass through another series of negatively charged aluminium plates. Here, the particles are attracted to the oppositely charged plate and stick to them like iron filings to a magnet, but with a difference - the particles remain adhered to the plates even when the electrostatic filter is powered off. The clean air, devoid of particles, escapes through the after filters. The postfilters help in distribution of the air flow through the electrostatic filter modules.

We are an ISO 9001:2008 Company

 ...For a Cleaner World

Dust Bag®, dust collectors, are fitted with Non-woven polyester fabric capable of capturing dust particles as small as 10 microns and are designed, developed and manufactured by Powertech Pollution Controls Pvt. Ltd., Bangalore, India.

Features: This equipment can capture large quantities of dust from any generating source with high capture efficiency. The DustBag® uses non-woven polyester cloth as the filter media. We can incorporate additional safety features such as pressure differential switch, fire retardant as well as antistatic filter media, etc, as optional accessories. These systems contribute to a safer, healthier work environment where toxic airborne pollutants are removed. We provide excellent factory support

Applications : DustBag®, dust collectors can be used to capture dry or mildly wet particles from tool & cutter grinders, cast iron machining, graphite / carbon machining, surface grinders, drilling, milling, deburring, polishing, mixing etc.,

How it works: The DustBag® dust collector can be used in 2 ways. It can be used for pedestral grinders or similar applications where the grinding wheel can be enclosed upto 70% with a specially designed suction hood. It can also be used for surface grinders, CNC machining, or similar application where the wheel or machining tool cannot be enclosed. In this case a rectangular suction hood can be placed facing the stream of the dust particles near the grinding wheel edge or machining tool edge. During the dust generation process, dust particles are drawn into the DustBag® through the suction hood. The larger dust particles in the airstream, after entering the DustBag® fall to the bottom collection tank immediately. The finer dust particles reach the filter bag and are trapped there. The filter bags can be de-dusted manually or automatically (option). It is not necessary to remove the bags for cleaning.

The following can be provided as optional extras : Motorised de-dusting (motorised bag shaker), Extractor Arm can be fitted, Tapered dust collection tank with trapdoor or rotary valve for dust removal

* Due to continuous innovation, specifications are subject to change without notice.

Extractor Arm

The Extractor Arm is a device which allows the user to position a suction hood to capture fumes or dust close the generation spot with complete ease and flexibility.

Features : This highly useful accessory may be used with the Fumekiller® and DustBag® units . Maintenance and running costs are low as all components are built for continuous , reliable , safe and efficient use. These systems contribute to a safer , healthier work environment where toxic airborne pollutants are removed. We provide excellent factory support and product expertise based on years of industrial process emission control.

The Extractor Arm consists of 2 ducts made of aluminium or stainless steel, connected by PVC flexible hoses and mounted on interconnected support rods with friction-loaded pivots. A suction hood is attached to one end. The other end is attached to a rotating hollow cylinder. The suction hood, ducts, hose and rotating cylinder form a passage for the fumes or dust. The entire arm is self balanced and articulated at 3 points. This allows the suction hood to be positioned by hand at any point with a reach of 2 meters (or 4 meters) to & fro and 2 meters (or 4 meters) up & down with complete ease & flexibility with minimum effort. The Extractor Arm can be fitted to most of our Fumekiller® models & Dustbag® models. The arm can also be fitted to overhead ducting to provide suction points close to the floor level for the capture of fumes or dust from pollution generation spots.

How it works : The Extractor Arm consists of elements of aluminium ducts joined by flexible hose, articulated at 3 fulcrum points. One end of the arm is fitted with a swivel fixture. The arm is self balanced using friction pads and a telescopic gas tube. The arm can be swivelled by hand through about 270 degrees and can be positioned easily within a nominal distance specified for each arm. With the Extractor Arm, fitted to the Fumekiller® or DustBag® the suction hood of the arm is to be positioned close to the fumes/dust generation spot. The fumes/dust will be sucked through the suction hood and will reach the Fumekiller® or DustBag® for further filtration.
